## MODULOR - CLAESSION KOIVISTO RUNE

The design trio of Mårten Claesson, Eero Koivisto and Ola Rune met as students. After graduating they opened their own architectural consultancy in 1995. Since then the scope of their assignments has expanded, and they now divide their time more or less equally between architectural projects and design. Their portfolio of successful projects is almost limitless.

The high quality of their work has brought them acclaim not only in Scandinavia, but also throughout Europe, in Japan, the USA and South America.

Today their designs are recognised and acknowledged worldwide. They have received numerous Swedish and international awards for their work and they remain totally uncompromising in their commitment to develop and improve without ever repeating themselves.

"The architect Le Corbusier developed his own scale of proportions that he called the Modulor system. This was based on the dimensions and proportions of the human body and the aim was to create a tool for good design and architecture. Our Modulor table is likewise based on a few simple key components – a leg, a joint and a rail. Plus a tabletop, of course. The dimensions of the profiles and tabletops can be simply adapted to virtually any desired format or proportion. Like a tool for good design and architecture.

The strength of the table – literally and metaphorically – is in the details. The extruded leg that meets the moulded joint that meets the extruded rail that meets the figure-milled edge of the tabletop...

Behind the precision of these details and the harmonious relationship between their individual forms are more than 1,000 hours of dedicated work from designers and product developers".
